

Subnet VPC and route-table

Learn AWS Billing, Monitoring & VPC in One Shot

Shubham Londhe crash course

(covers subnet VPC and route-table subnet association)

https://youtu.be/KmNZo741hsg?si=8FbStIVKr5_7wwHI&t=1777

{

Creating EC-2 instance TEST-INSTANCE manually instead of selecting the default settings:-

-Created a **test-public-subnet** and **test-vpc** then launched our EC2 test-instance inside it

Tried to connect using EC2 instance connect and **failed** because our **test-public-subnet** is still private

(every created subnet is private by default, if internet gateway is connected it becomes public else remains private)

-Go to internet gateway and create **test-igw** (internet gateway)

-Then created a **test-rt** (route table) which will be created inside our **test-vpc**

-Now goto route table>subnet association>edit associations>

tick **test-public-subnet** with click Save Associations

After this step out **test-public-subnet** is associated with our **test-rt**

Go back to subnets > edit and tick "Auto assigning public ipv4" > then click save

-Still out internet gateway doesn't know about our route table.

Hence we goto **test-igw** and attach it to our **test-vpc**

-Finally get back to route tables, select **test-rt** , click Routes> edit routes > Add a route (0.0.0.0/0) and also attach **test-igw** as target
}

THIS IS HOW OUR CONNECTION FROM (LOCAL) TO (VPC)
WORKS
